Security Agent

	by zero error
	le attempts to divide an integer by zero, which is undefined and will cause a runtime exception. This can lead to application crashes or u
	that the divisor (b) is not zero before performing the division operation. You should add a check to prevent division by zero. For exampl
n	
t	
a / b)	
	Error: Division by zero')
	I handle the situation gracefully and avoid runtime errors.

Performance Agent

the divisor is zero, which will result in a runtime error (specifically, a ZeroDivisionError). This is not related to performance but is crucial for ensuring the division. You can add a check or handle this case appropriately.

Documentation Agent

division by Zero Error and Lack of Documentation

The code does not handle the division by zero case, which will raise an exception. Additionally, there is no documentation or comments explaining what the script does or to describe the purpose of the script. Introduce error handling to manage the division by zero scenario and use more descriptive variable names.

Repaired Code

```
try:
    print(a / b)
except ZeroDivisionError:
    pass
```
